150 m

CAR

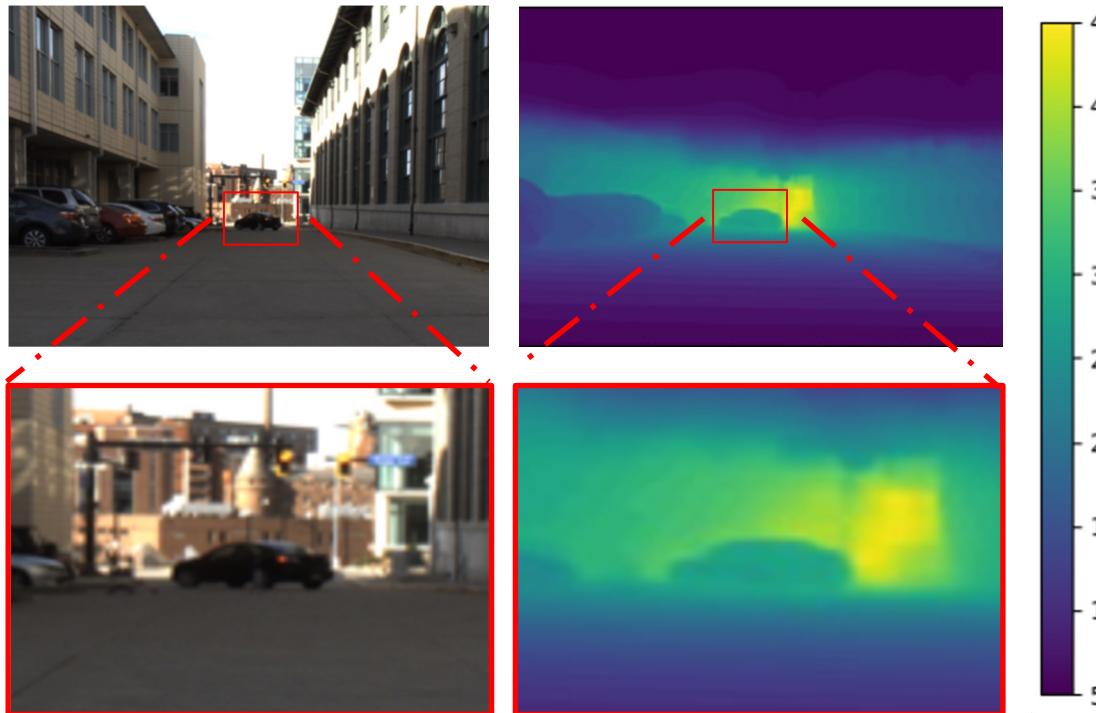

150 m

75 m

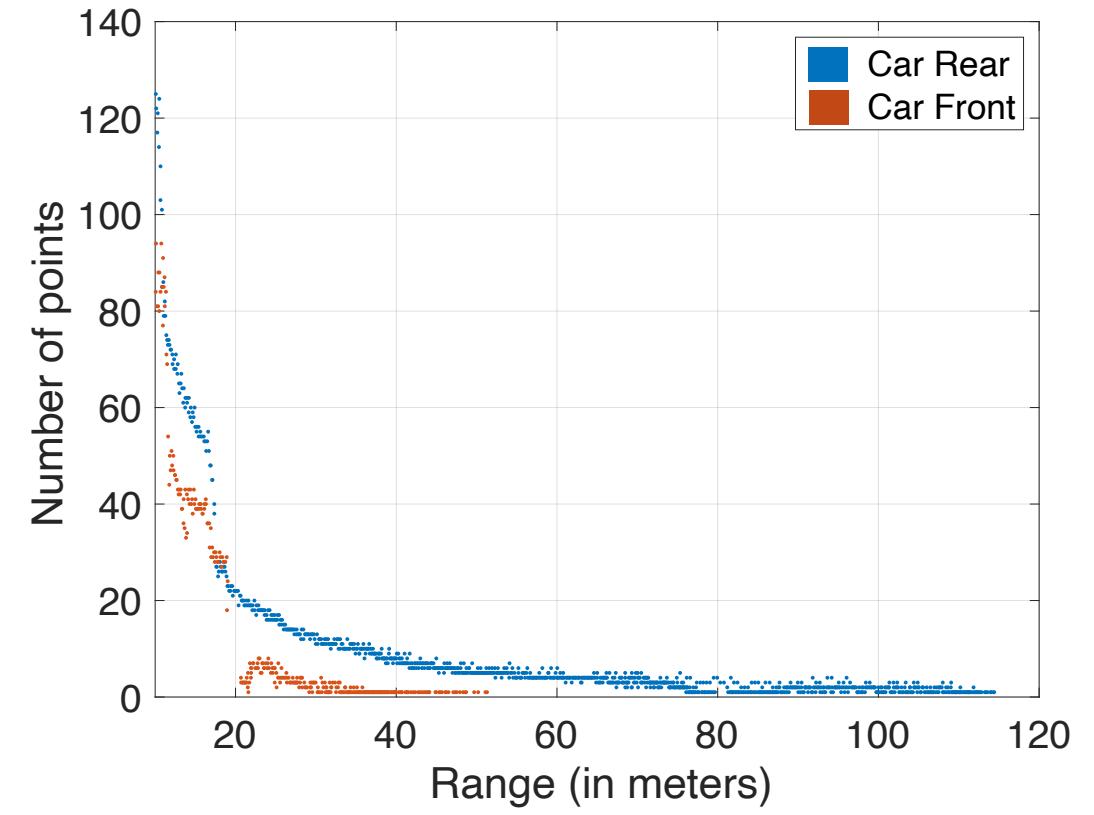

Single vantage point high-res long-range depth imaging

# Options Today

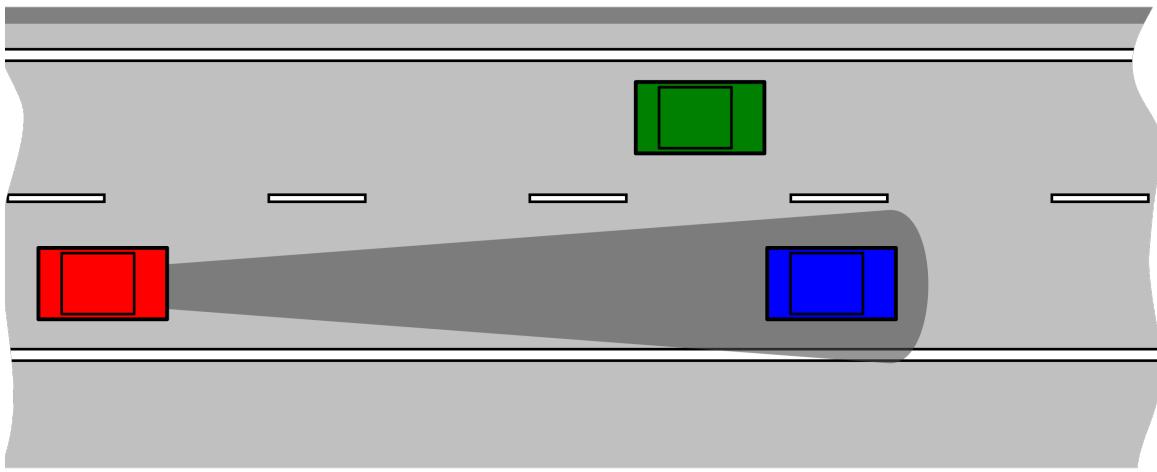

10s of meters depth error at long ranges

Stand alone lidar

# Case for Radar

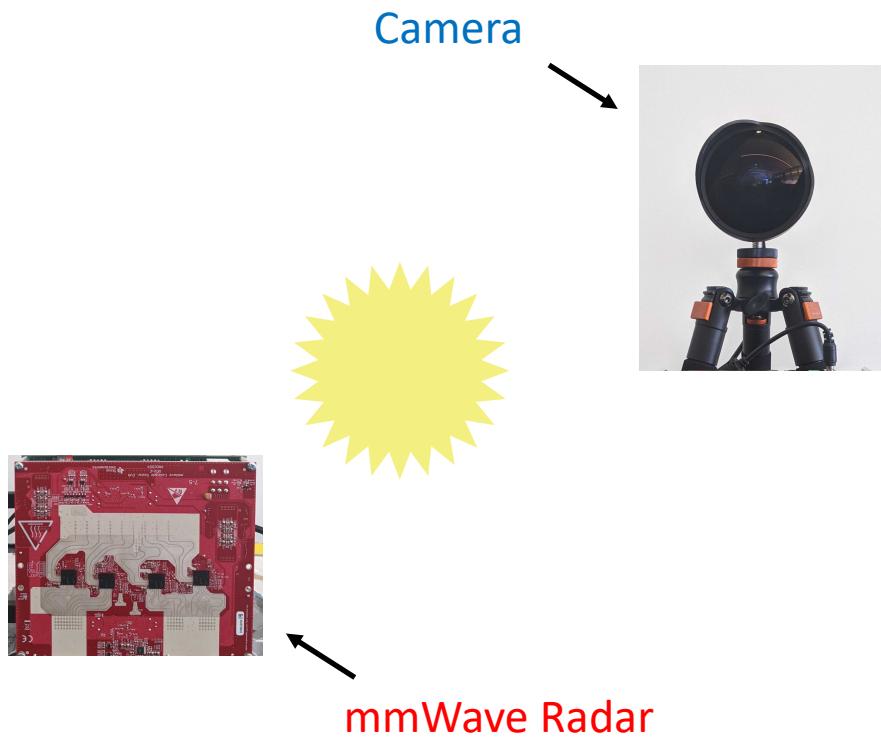

Cruise Control Radar already used for  
100s of meters depth estimation

|                                      | Monocular Camera | Radar |
|--------------------------------------|------------------|-------|
| Long-range Depth Estimation Accuracy | Poor             | Good  |
| Angular Resolution                   | Good             | Poor  |

# METAMORAN

Exploring **mmWave Radar** and **Camera Fusion** for High-Resolution  
and Long-Range Depth Imaging

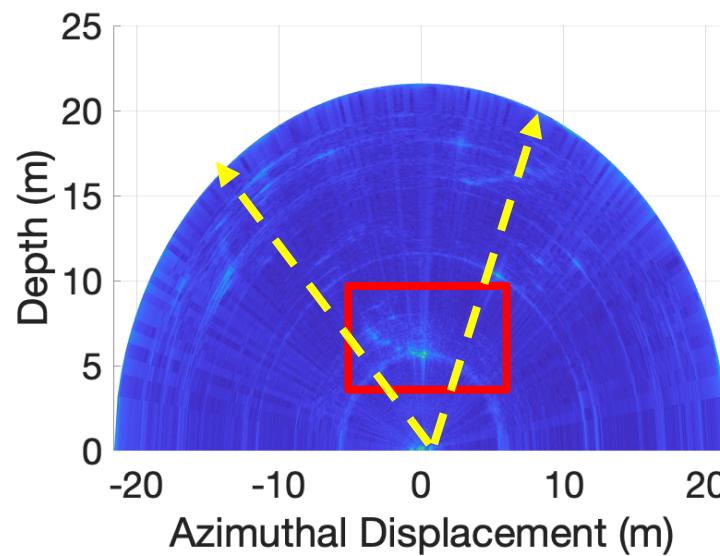

Fusion Dance From Dragon Ball

# Challenges

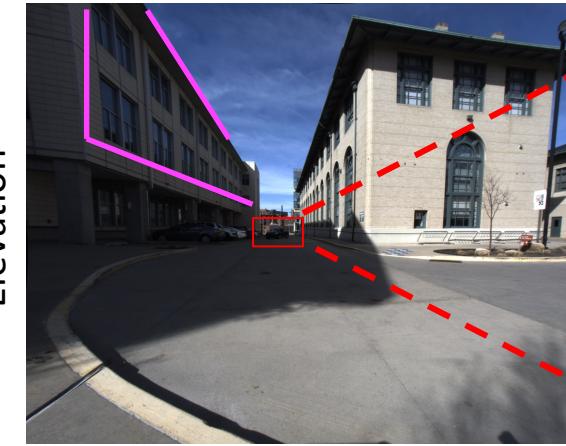

Elevation

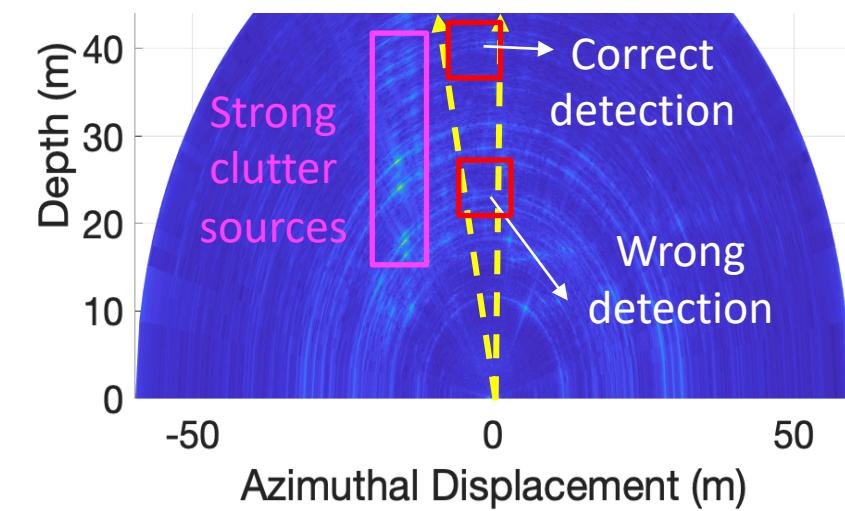

Azimuth

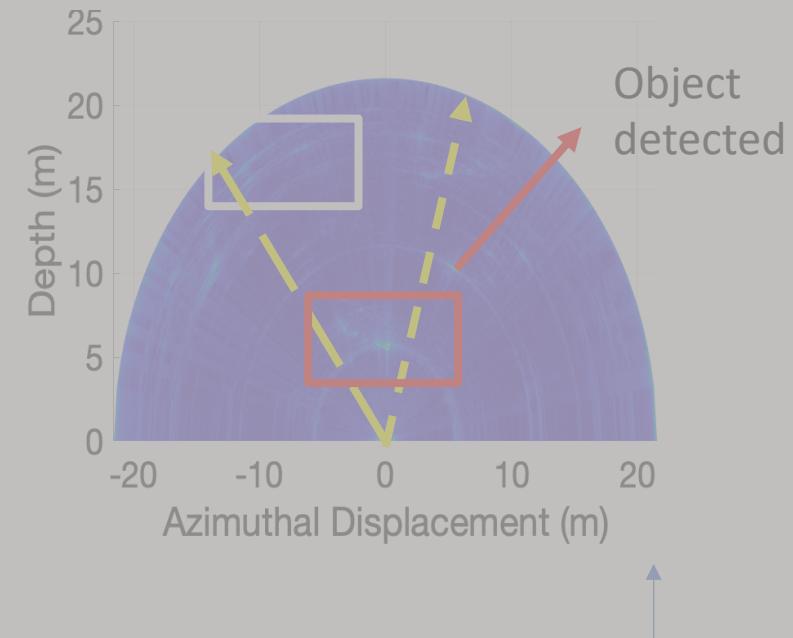

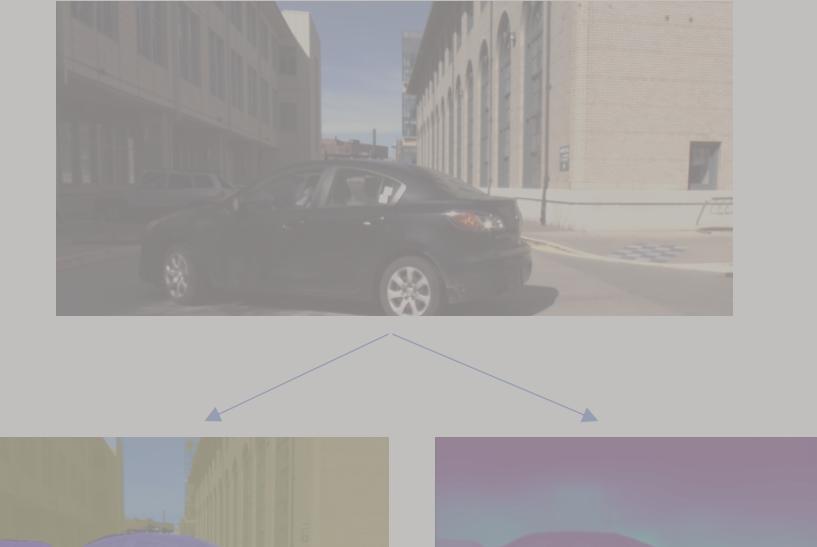

Elevation

Azimuth

# Robust Object Detection in Clutter

More details in paper

1. Clutter suppression
2. Creating a higher res depth image

3D object shape

elevation slice

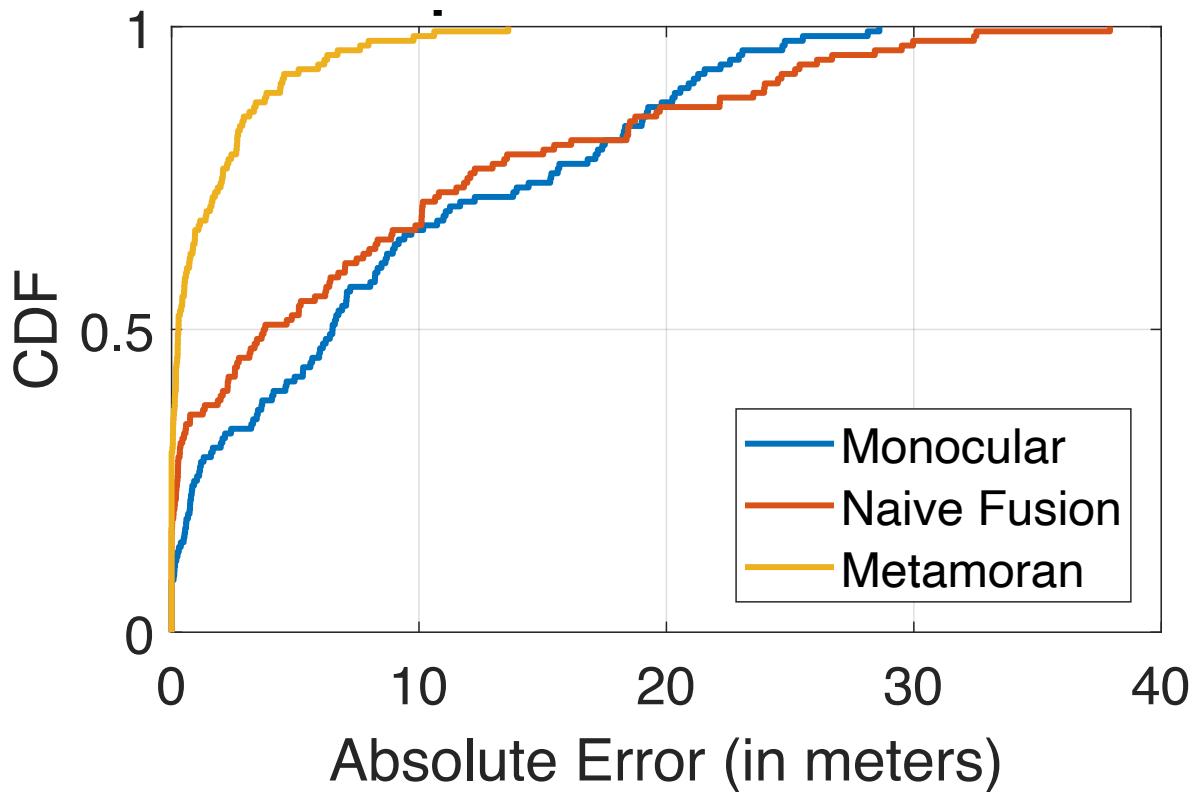

Contour

Synthesized Radar Contour template

# Results

Evaluation showing

- Error of 28 cm at long ranges
- **13x** better than naïve radar-camera fusion and **23x** better than monocular alone

# Conclusion

Fuse **mmWave radar** and **camera** for single vantage point long-range depth imaging

System design to help **radar** leverage information from **camera**

- Detect true objects in radar at long ranges
- Suppress clutter
- Create high resolution depth images

Evaluation at long ranges of 100-300 meters
